MiniSim Data Acquisition Cell Definitions

The data collection requirements for the simulator are listed in the following table.

CSSDC = Change State Signal Data Collection, and indicates that data is collected only when the state changes.

| Auto Transmission Mode CFS_Auto_Transmission_Mode CFS_Auto_Transmission_Mode CFS_Auto_Transmission_Mode 1 = Reverse 0 = Neutral 1 = First 2 = Second 3 = Drive 4 = Overdrive 4 = Overdrive Brake pedal position Radios status CIS_Entertainment_Status CIS_Entertainment_Status Steering wheel angle Steering wheel angle Steering wheel angle rate CFS_Steering_Wheel Angle_Rate Steering wheel torque CFS_Steering_Wheel Angle_Rate Steering wheel torque CFS_Steering_Wheel Torque CFS_Transfer_Case_Mode CFS_Transfer_Case_Mode CFS_Transfer_Case_Mode CFS_Transfer_Case_Mode CFS_Transfer_Case_Mode CIS_Auxiliary_Buttons CIS_Auxiliary_Buttons CIS_Auxiliary_Buttons CIS_Joystick_Type CIS_Joystick_Type CIS_Joystick_Type CIS_Joystick_Type CIS_Joystick_Buttons CIS_Joystick_Buttons CIS_Joystick_Buttons CIS_Cruise_Control CIS_Cruise_Control CIS_Cruise_Control CIS_Cruise_Control CIS_Turn_Signal CIS_Turn_Signal CIS_Turn_signal on CIS_Lourn signal on CIS_Lournsignal o | Collection Freq | Units/Values | NADS Var Name | Definition |

| Data Reduction Segment Type | SCC_DataRed_Segments | Integer ≥ 0 | 60 Hz |
| Bit mask of Audio and Visual states | SCC_DynObj_AudioVisualState | 2 integers | 60 Hz |
| Scenario object's color index | SCC_DynObj_ColorIndex | Integer 1 - 5 | 60 Hz |
| Cved IDs of Scenario Objects | SCC_DynObj_CvedId | Integer ≥ 0 | 60 Hz |
| Indicates how many valid objects in SCC_DynObj Array | SCC_DynObj_DataSize | integer | 60 Hz |
| Scenario object's HCSM Type | SCC_DynObj_HcsmType | integer | 60 Hz |
| Headings of Scenario Objects | SCC_DynObj_Heading | degrees | 60 Hz |
| Name of scenario object | SCC_DynObj_Name | array of char | 60 Hz |
| Position of scenario object | SCC_DynObj_Pos | feet | 60 Hz |
| Roll and Pitches of Scenario Objects | SCC_DynObj_RollPitch | degrees | 60 Hz |
| Sol IDs of Scenario Objects | SCC_DynObj_SolId | Integer ≥ 0 , it is the order in which the different objects are listed within the sol2.txt file | 60 Hz |
| Velocities of Scenario Objects | SCC_DynObj_Vel | ft/s for DDOs (HcsmType = 1) m/s for ADOs (HcsmType = 10) | 60 Hz |

| Definition | NADS Var Name | Units/Values | Collection Freq |
|---|-----------------------------|---|-----------------|
| Status of an event | SCC_EventStatus | 0/1. 0 means no event is active. 1 means there is an active event. Needs to be set to 1 at least once to indicate the drive has started and run time data reduction, including those overall evaluations and sliding window based evaluations, should be started. | CSSDC |
| Index of an event | SCC_EventNumber | 120. A maximum of 20 events can be defined. | CSSDC |
| Time since drive started. | SCC_Eval_Exec_Time | Seconds. The clock starts the first time SCC EventStatus is set to 1. | CSSDC |
| Total number of collisions | SCC_Eval_Collisions | Total number of collisions so far in the drive (i.e. from when the event status is set to 1 for the first time). | CSSDC |
| Maximum own vehicle speed | SCC_Eval_Max_Speed | MPH. Maximum own vehicle speed so far. | CSSDC |
| Average OV speed | SCC_Eval_Avg_Speed | MPH | CSSDC |
| Standard deviation of OV speed | SCC_Eval_SpeedSD | MPH | CSSDC |
| Standard deviation of OV lane position | SCC_Eval_Overall_SDLP | Feet | CSSDC |
| Total number of OV lane departures | SCC_Eval_Lane_Departures | Lane departures as the LDW system indicates. | CSSDC |
| Percentage of time when the OV is considered departed from the lane | SCC_Eval_Lane_Departure_Pct | 0% 100% | CSSDC |
| Total number of occasions when the OV is 5MPH or more above the speed limit | SCC_Eval_Speedings | There is a debounce time of 30 seconds. So within 30 seconds the count won't increase even if the OV violates the speed limit multiple times during that time span. | CSSDC |
| Percentage of time when the OV is 5MPH or more above the speed limit | SCC_Eval_Speeding_Pct | 0% 100%. Debounce time is not used here. It's the actual frame count when the OV violates the speed limit measured against the total frame count of the drive so far. | CSSDC |
| Average distance between OV and a lead vehicle | SCC_Eval_Avg_Hdwy | Feet. The distance is only averaged among the frames when there is a lead vehicle as reported by the scenario controller. | CSSDC |
| Number of collisions during an event. | SCC_Eval_Event_Collisions | An event is defined by SCC_Event_Status and SCC_Event_Number. The status needs to be 1 and the number needs to be between 1 and 20. | CSSDC |
| Maximum OV speed during an event. | SCC_Eval_Event_Max_Speed | MPH | CSSDC |
| Minimum OV speed during an event | SCC_Eval_Event_Min_Speed | MPH | CSSDC |
| Average OV speed during an event | SCC_Eval_Event_Avg_Speed | MPH | CSSDC |
| Standard deviation of OV speed | SCC_Eval_Event_SpeedSD | MPH | CSSDC |

| during an event | | | |
|---|---------------------------------------|---|-------|
| Standard deviation of OV lane position during an event | SCC_Eval_Event_SDLP | Feet | CSSDC |
| Number of OV lane departures during an event | SCC_Eval_Event_Lane_Departur es | | CSSDC |
| Percentage of time when the OV is considered departed from the lane during an event | SCC_Eval_Event_Lane_Departur e_Pct | 0% 100% | CSSDC |
| Number of occasions when the OV is 5MPH or more above the speed limit during an event | SCC_Eval_Event_Speedings | See remarks for SCC_Eval_Speedings. | CSSDC |
| Percentage of time when the OV is 5MPH or more above the speed limit during an event | SCC_Eval_Event_Speeding_Pct | 0% 100%. See remarks for SCC_Eval_Speeding_Pct. | CSSDC |
| Average distance between the OV and a lead vehicle during an event | SCC_Eval_Event_Avg_Hdwy | Feet. See remarks for SCC_Eval_Avg_Hdwy. | CSSDC |

| Definition | NADS Var Name | Units/Values | Collection Freq |
|--|---------------------------------------|---|-----------------|
| lengths of windows preceding the current frame, to be used for run time data reduction | SCC_Eval_Window_Duration | Seconds. A total of 10 windows of different duration can be defined. There is a build up time for the window at the start of the drive as data are being filled in the windows. The length of the build up time is the same as the length of the window. The values during the build up time should be discarded. | CSSDC |
| Number of collisions in a window of predefined duration preceding the current frame | SCC_Eval_Window_Collisions | | CSSDC |
| Average OV speed in a predefined window | SCC_Eval_Window_Avg_Speed | MPH | CSSDC |
| Standard deviation of OV speed in a predefined window preceding the current frame | SCC_Eval_Window_SpeedSD | MPH | CSSDC |
| Standard deviation of OV speed in a predefined window preceding the current frame | SCC_Eval_Window_SDLP | МРН | CSSDC |
| Number of OV lane departures in a predefined window preceding the current frame | SCC_Eval_Window_Lane_Depar tures | | CSSDC |
| Percentage of time when the OV is considered departed from the lane in a predefined window preceding the current frame | SCC_Eval_Window_Lane_Depar ture_Pct | 0% 100% | CSSDC |
| Number of occasions when the OV is 5MPH or more above the speed limit in a predefined window preceding the current frame | SCC_Eval_Window_Speedings | See remarks for SCC_Eval_Speedings. | CSSDC |
| Percentage of time when the OV is 5MPH or more above the speed limit in a predefined window preceding the current frame | SCC_Eval_Window_Speeding_P ct | 0% 100%. See remarks for SCC_Eval_Speeding_Pct. | CSSDC |
| Average distance between the OV and a lead vehicle preceding the current frame | SCC_Eval_Window_Avg_Hdwy | Feet. See remarks for SCC_Eval_Avg_Hdwy. | CSSDC |
| Average angular velocity rate of gaze angle in a predefined window preceding the current frame | SCC_Eval_Window_Gaze_Avg_ AnguRate | Radians/Second. See remarks for SCC_Eval_Gaze_AnguRate. | CSSDC |
| Standard deviation of angular velocity rate of gaze angle in a predefined window preceding the current frame | SCC_Eval_Window_Gaze_Angu RateSD | Radians/Second. See remarks for SCC_Eval_Gaze_AnguRate. | CSSDC |
| Current angular velocity vector of the gaze angle | SCC_Eval_Gaze_AnguVel | Radians/Second. This is calculated from the eye tracker real time gaze rotation angle of the first eye, ET_gaze_rot_unfiltered[0] and ET_gaze_rot_unfiltered[1], representing pitch and yaw angle of the first eye, respectively. In the 240Hz DAQ file there will be a delay of 4 to 8 frames between the gaze angles and the angular velocity calculated from them. | CSSDC |
| Magnitude of the current angular velocity vector of the gaze angle | SCC_Eval_Gaze_AnguRate | Radians/Second. This is a scalar value, the length of the gaze angular velocity vector. | CSSDC |
